Longer Connection Distance

The maximum distance between two servo stations is 50m and a maximum of 65,536 axes can be connected

Compatible with Previous Models

The ASDA-B3 series models are compatible with the ASDA-A2 and ASDA-A3 series

Note: The communication cycle of the ASDA-A2 series is 1ms, so when previous and new models are used together, the set value cannot be lower than this specification

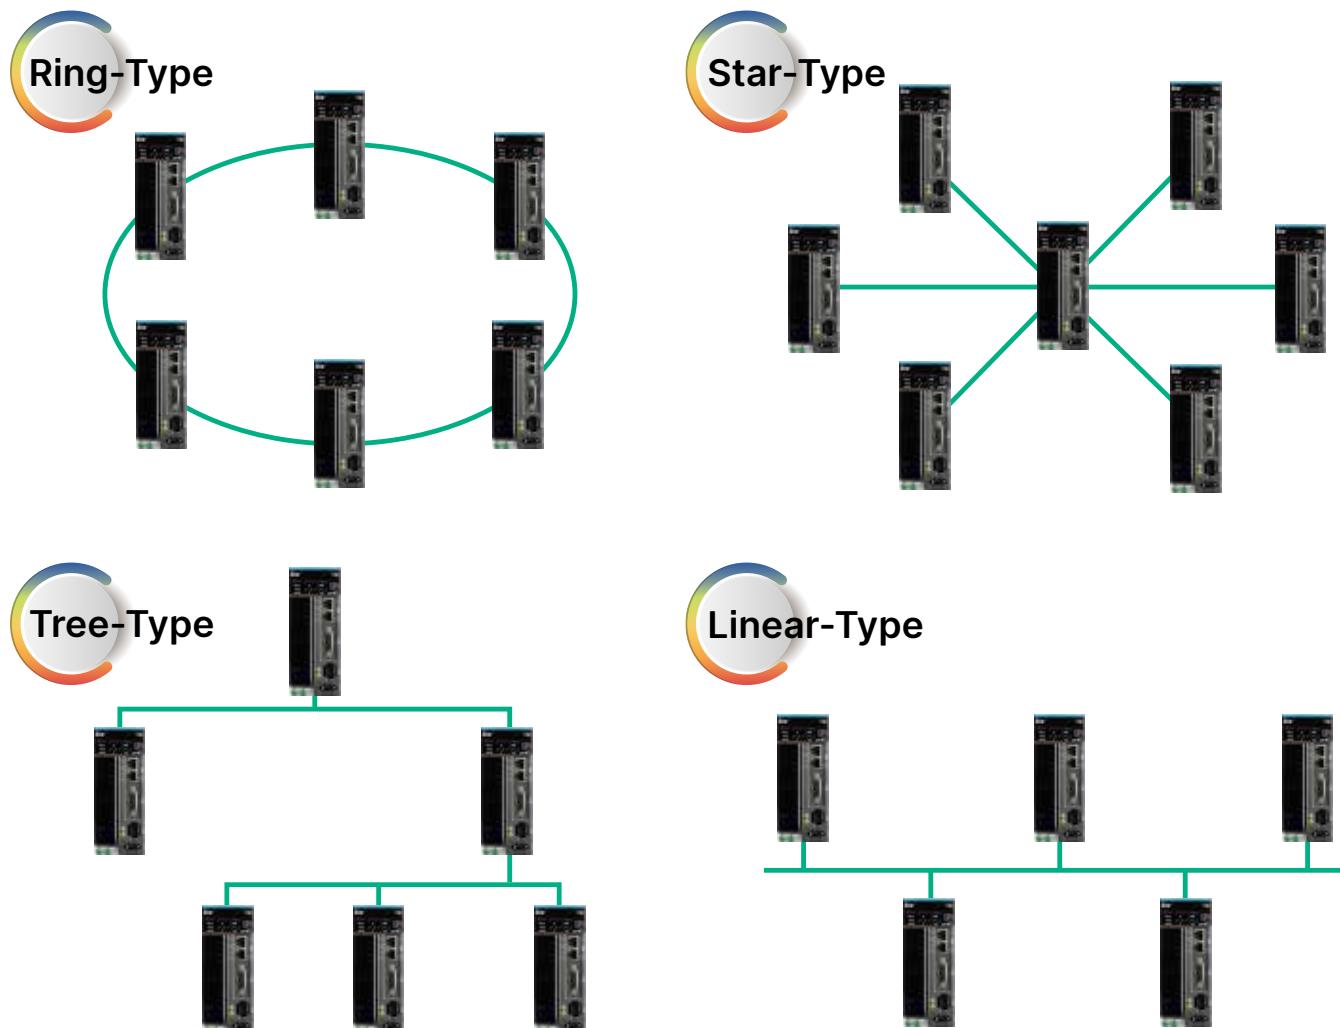

PROFINET Communication Functions

Vibration Suppression Functions

Vibration Elimination

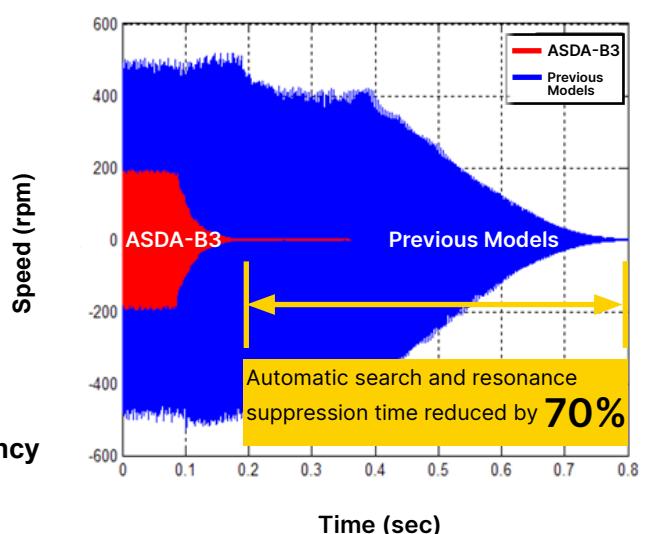

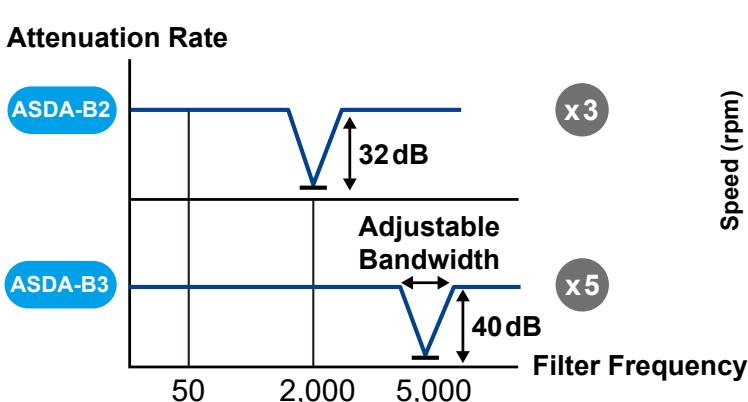

- Low frequency vibration suppression applies Delta's unique algorithm to adjust low rigidity machine structures
- Two sets of built-in vibration elimination settings reduce jitter at the machine endpoint while maintaining a good command response

Without Vibration Elimination - Machine endpoint vibrates when settling **With Vibration Elimination** - Machine endpoint is stable when settling

Advanced Notch Filter

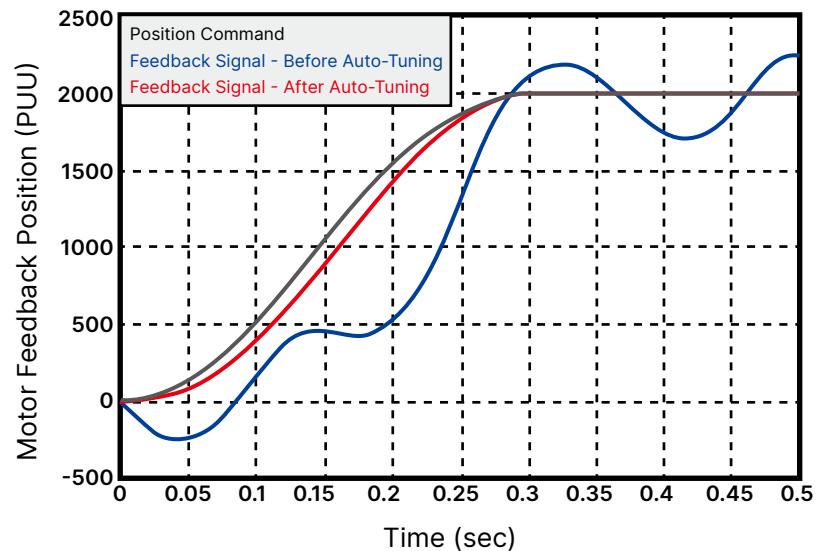

- High frequency resonance suppression increased from 3 sets to 5 sets compared with previous models
- Filter bandwidth increased to 5,000 Hz
- Automatically searches for the resonance frequency point and completes the resonance suppression; this reduces the time by 70% compared with previous models and is less likely to damage the machine

Self-Diagnosis and Adaptation

Outstanding Self-Adjusting Capability

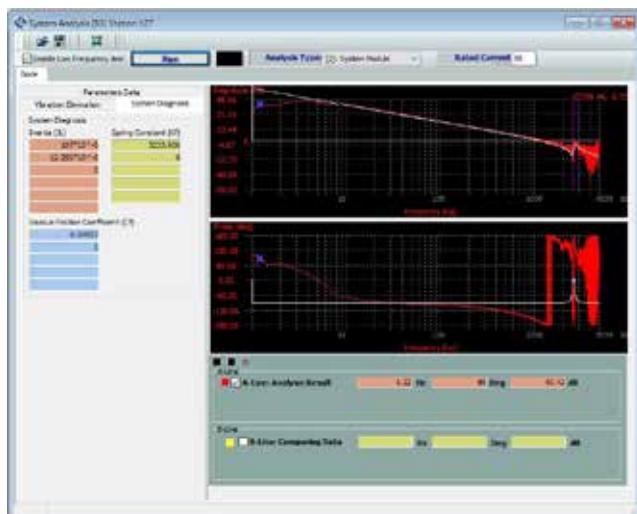

- Dedicated algorithm allows easy tuning with simple settings, which improves the efficiency of equipment assembly and testing
- Suitable for applications with flexible machine structures and large variations in inertia

System Analysis Tool

Mechanical Stiffness Diagnosis

- Diagnoses the mechanism elasticity and damping coefficient, and converts the machine structure characteristics into data
- Ensures consistency of mass production machines through data collection

Frequency Domain Response Analysis

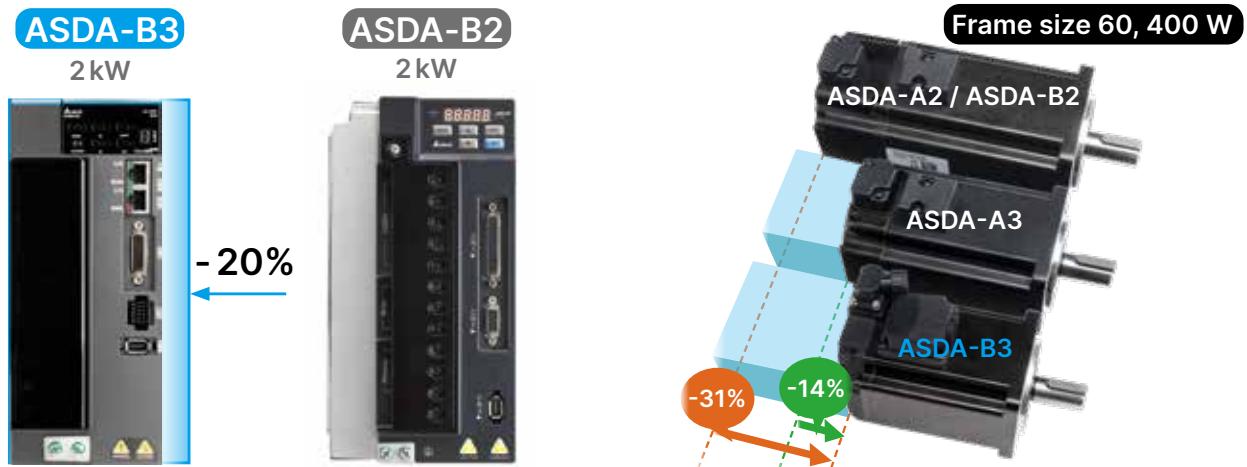

- Ensures system stability
- Compares the phases before and after gain adjustment to ensure the safety margin of the system

Energy-Saving and Compact Size

Compact Size

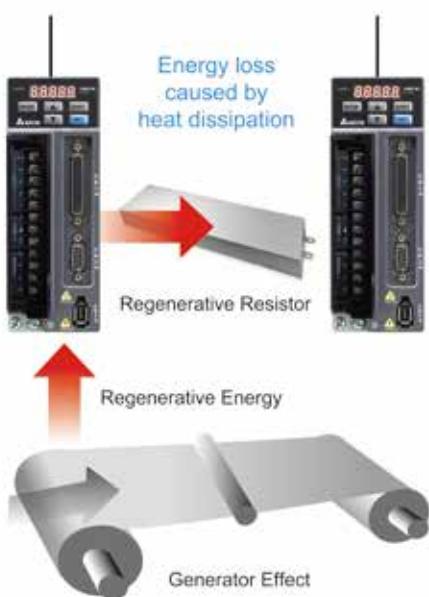

- The size of the servo drive is reduced up to 20%, so it requires less space in the distribution board which meets the need for more compact equipment
- The size of the servo motor is reduced up to 31% for less space and cost efficiency

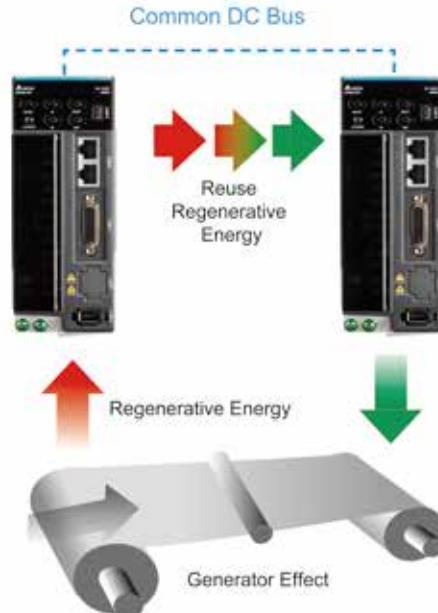

Common DC Bus

- The servo drives can share the DC Bus to reuse regenerative energy for reducing energy consumption
- When multiple servo drives share the common DC Bus, fewer regenerative resistors are required for cost efficiency

Servo Drives w/o DC Bus

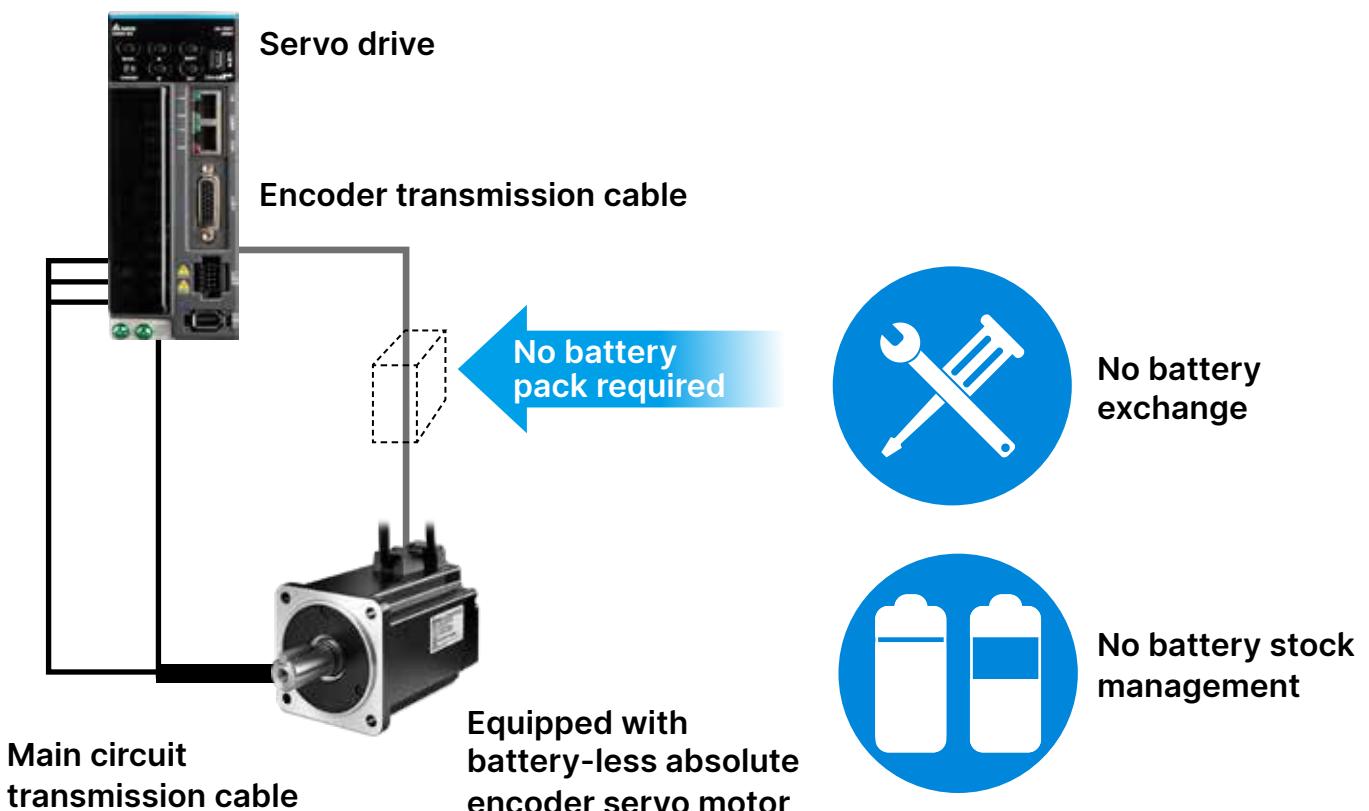

ASDA-B3 DC Bus Structure

Battery-Less Absolute Encoder

- Electromagnetic induction: When the power is off, the magnet on the encoder shaft rotates. The magnetic field changes are used to induce the electrical energy generated by the Wiegand wire coil to record the number of turns of the encoder for final absolute position
- No gear set: As it records laps for a long period, problems with gear life and mechanism will occur
- No battery pack: Reduces battery maintenance time, avoids battery exhaustion and anomalies, avoids lithium battery transportation

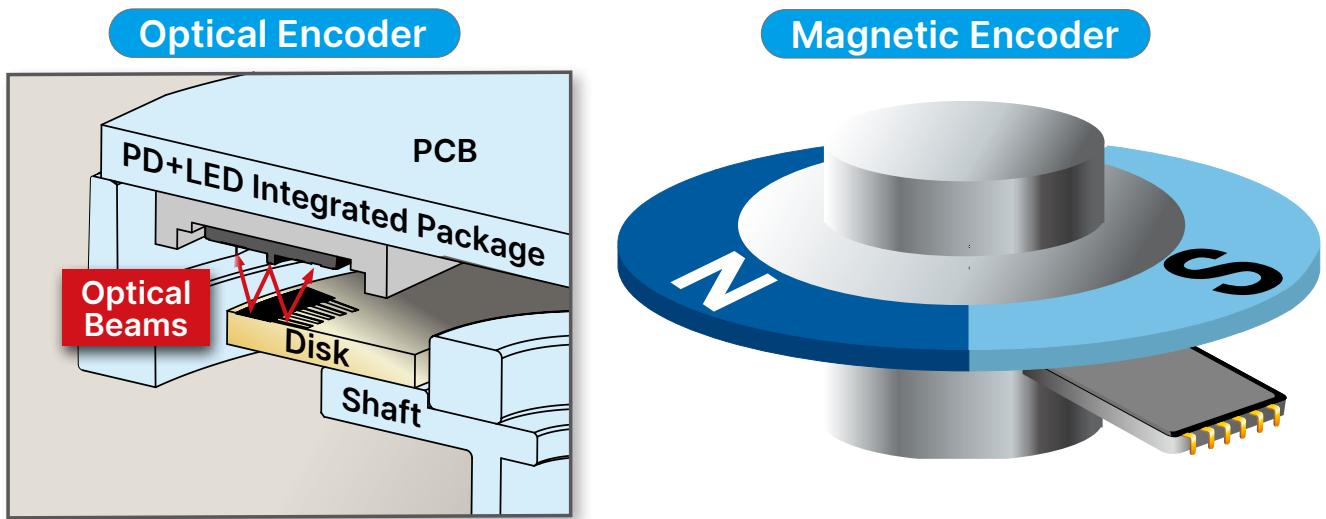

Reduced Cost & Maintenance

Multiple Selections

High Resolution Encoder

- High resolution for more precise positioning
- The incremental encoder can retain the single-turn absolute position without the need to execute homing after cycling the power
- After the absolute encoder is powered off, the number of turns and position are retained
- 24-bit optical encoder: The encoder is lighter and thinner with the reflective sensor technology; the exclusive optical sensor compensation function improves product reliability
- 17-bit magnetic encoder: The magnetic induction technology improves the capability to prevent vibration and increases the oil resistance level

High Compatibility
